

```

#include <iostream>
#include <cmath>
using namespace std;

class findtotal
{
public:

    double total_price (float KM)
    {
const float price = 1.2;
double total;

    if (KM <= 200)
    {
        total = (KM * price);

    }
    else if (KM > 200)
    {
        total = (((KM - 200) * price)*( 75.0/100.0)) + (200 * price));

    }
    return total;
    }
};

int main ()
{
float distance;
cin >> distance;

findtotal result;

cout << round(result.total_price(distance)) << endl;

}

```
