

```

#include <stdio.h>

int main() {
    // Initialize global variables
    init();

    // Declare and initialize string pointers
    char *str = s1;
    char *key = s2;

    // Initialize occurrence count to 0
    int count = 0;

    // Calculate lengths of both strings
    int len1 = 0;
    for (int i = 0; str[i] != '\0'; i++) {
        len1++; // increment length of str
    }
    int len2 = 0;
    for (int i = 0; key[i] != '\0'; i++) {
        len2++; // increment length of key
    }

    // Loop through str, checking for occurrences of key
    for (int i = 0; i <= len1 - len2; i++) {
        int flag = 0; // flag to indicate mismatch

        // Loop through key to compare characters
        for (int j = 0; j < len2; j++) {
            if (str[i + j] != key[j]) {
                flag = 1; // mismatch found
                break;
            }
        }

        // If no mismatch found, increment occurrence count
        if (!flag) {
            count++;
        }
    }

    // Print the number of occurrences
    printf("%d", count);

    return 0;
}

```
